Wednesday June 20th

Today was the first day I attended of the Rocky Mountain Biohackathon. I mistook the schedule thinking today was the first day of the actual hacking, however, I was pleasantly surprised by the lineup of excellent speakers. Speakers included Ben Langmead, of Bowtie fame, on pan-RNA seq processing pipelines on the cloud. John Rinn described bar-coding RNA like the first Juicy Fruit gum package and James Taylor, of Galaxy web-server fame, described novel ways to interpret chromatin structure.

Martin introduced me to assemblathon, optical mapping, and the troubles of short read assembly.

I enjoyed a lovely bike ride around Boulder and returned to the conference for more interesting talks. I did have the misfortune of leaving my sunglasses somewhere between the afternoon session and when I left the conference. Stressed out, I ran over to mincha/maarav at EDOS.

Goals: Finish Review Article

Thursday June 21st

The first day of the Hackathon began with some background from our team leader Upendra. The group discussed many pieces of the project eventually accepting the path to create a true positive using the protein MS/MS data available. I learned a helpful hint of storing data on a separate branch to prevent other users from having to download the full scope of the repository. I finished the review article.

Sunday June 23rd

I begin packing for the move tomorrow.

Week of 25 June 2018

Wednesday June 27th

I have finished moving except for a load of laundry left at Adam and Cyn's. I will make the bed and do a little cleaning before unplugging from the residence. My new apartment is wonderful with central air. I need to find bedding and my shower curtains (in backpack) and take the chairs back from the storage unit. Michael is still working on the draft of the systems biology review and will distribute the manuscript soon for edits.
